Abstract—This is a website on which you can find my personal details about graduation, hobbies, skills, working experience and my achievements. The website contains six sections and five pages in total. Pages are home, about me, services, skills and contact me. In each page, menubar on top and contact form in bottom is included.

Index Terms—HTM, CSS, PHP, MYSQL, BOOTSTRAP & JAVASCRIPT.

I. INTRODUCTION

A Portfolio website is a great way to demonstrate the competencies someone would list on a resume. It allows someone to show and not just tell. It presents evidence of someone's relevant skills and abilities.

Portfolios aren't just for creative professionals, everyone should have one. A professional portfolio is a tool that can help bring your stories to life, in a tangible way. By showing physical examples of your work and accomplishments, you'll be better able to prove your skills and experiences.

The best thing a portfolio website has is there is no disadvantages of having it. But it has so many advantages to talk about. Like- a smart way to show skills, helps potential clients visualize working with you, it generates credibility, improves chances of gaining customers, gives a chance to show your creativity etc. In this website we will see it has six sections and five pages named home, about me, services, skills and contact me. The website is fully responsive and compatible for all devices like mobile phones, tablets and computers. And all hover effects are pure hand coded.

II. LITERATURE REVIEW

I have viewed many similar websites for this project. Like Prokash Shahi's portfolio, Alexa's website and some from YouTube. Their project features and animations were cool to see. So I have taken some of their ideas and code for those animations and features. The viewed websites have some common features like- Auto typed animation, buttons become big after hover on it, skill showing by percentage, contact with social media profile buttons etc.

III. PROPOSED METHODOLOGY

In this website I have used HTML for creating the main structure of the website. Used CSS for changing colors, style, weight, font-family, giving some animations and hover effects etc. Bootstrap is used for making the website responsive. I have used JavaScript and JQuery for plugins and animations. **Let's see a portion of code:**

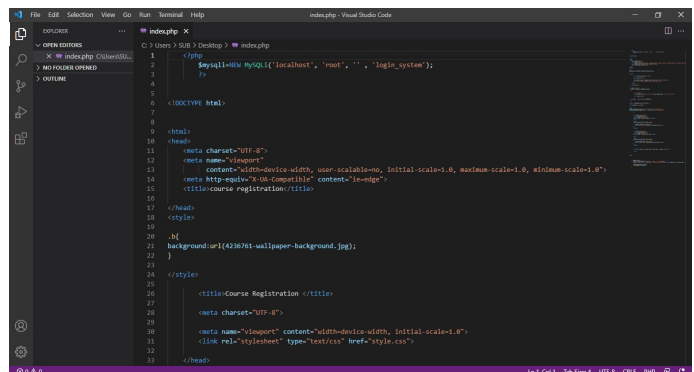

Fig. 1. Some Code

IV. CONCLUSION AND FUTURE WORK

If you see at the banner, the first thing you will notice is its auto typed text which says I'm a student, developer, freelancer etc. Here I used an auto typed effect into the whole banner section. There are two big buttons named "Hire me" and "Download CV" in the bottom of the banner section and four social media round shape buttons just below those two buttons. All of those buttons have a cool hover effect.

In this project I just create an interface by using HTML, CSS, Bootstrap, JavaScript and JQuery. The website is responsive but not dynamic. There is no admin panel here to change the pictures, banners and texts.

So in the future, I will use PHP, MySQL and the Laravel framework to make the website dynamic.

ACKNOWLEDGMENT

I would like to thank my honourable **Khan Md. Hasib Sir** for his time, generosity and critical insights into this project.
